Strand: Physics

RHS

What should I already know?

- We have four seasons (autumn, winter, spring and summer).
- The Sun is a source of light but the Moon is not.
- Know that a **shadow** is caused when an object blocks light from passing through it.
- To know the history of space travel.
- The properties of a **sphere**.

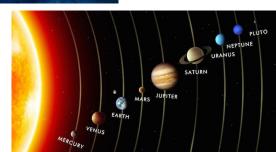

• The prop	erties of a sphere .
	What will I know by the end of the unit?
What causes day and night?	 The Earth rotates on its axis anti-clockwise and makes a complete rotation over 24 hours (a day). This makes it appear as the Sun moves through the sky but the Earth's rotation causes day and night. Different parts of the Earth experience daylight at different times - this means that it is morning, afternoon and night in different places. This is also the reason why we have time zones. Because of the Earth's tilt, the poles experience 24 hours of sunlight in the summer, and very few hours of sunlight in the winter. As the Earth rotates, shadows that are formed change in size and orientation.
Year length and the seasons	 The Earth takes 365 and a quarter days to orbit the Sun. Because of the extra quarter day it takes to orbit the Sun, every four years on Earth is a leap year! It is the Earth's tilt that causes the seasons.
The Moon	 The Moon orbits the Earth anticlockwise and takes approximately 28 days. The Moon spins once on its axis every time it orbits Earth. This means that we only see one side of the Moon. The Moon has different phases depending on where it is in its orbit. The Moon's gravity causes high and low tides.
What is the Solar System?	 There are 8 planets in our Solar System (Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus and Neptune). Pluto is a dwarf planet. They all orbit the Sun, which is a star, and they all have moons. The first four planets are relatively small and rocky, while the four outer planets are gas giants (Jupiter and Saturn) or ice giants (Uranus and Neptune). There are also asteroids, meteoroids and comets in the Solar System. The Solar System is in a galaxy called the Milky Way. The galaxy is in the universe.

The Sun, Earth and Moon are

- approximately spherical.
- The Earth **orbits** the Sun.

The Moon **orbits** Earth.

When the Moon passes between the Sun and Earth, the **shadow** cast by the Moon falls on the Earth's surface and we would no longer be able to see the Sun. This is called a **solar eclipse**.

	Vocabulary					
asteroid	a rock that orbits the Sun in a belt between Mars and Jupiter					
axis	an imaginary line through the middle of something					
comet	a bright object with a long tail that travels around the Sun					
galaxy	an extremely large group of stars and planets. Our galaxy is called the Milky Way.					
gravity	the force which causes things to drop to the ground					
leap year	a year which has 366 days. The extra day is the 29th February. There is a leap year every four years					
meteorite	a rock from outer space that has landed on Earth					
orbit	the curved path in space that is followed by an object goinground and round a planet, moon, or star					
planet	a large, round object in space that moves around a star					
shadow	a dark shape on a surface that is made when something stands between a light and the surface					
Solar System	the Sun and all the planets that go round it					
sphere	an object that is round in shape like a ball					
spin	turns quickly around a central point					
star	a large ball of burning gas in space					
time zones the time is calculated as being a particular nu hours behind or ahead of GMT (Greenwich M						
universe	niverse the whole of space and all the stars, planets, and othe forms of matter and energy in it					
Investigate!						
Constru	e the time of day at different places on Earth. Ict shadow clocks and sundials. Moon diary over the course of a month - what					

• Keep a Moon diary over the course of a month - what do you notice?
